

## Write a program that processes a two-dimensional array (3 \* 3)

### Additional requirements and list of steps:

1. Define the dimensions of the array as a constant.
2. Fill the array with random numbers in the range R.
3. Display the contents of the array.
4. Displaying the contents of an array must be implemented as a function
5. Calculate the value of "a", "b" and "c".
6. Display the values "a", "b" and "c".
7. The program should output a text message in case of an error.

| Variant | Task                                                                                                                                            | R               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| 1       | a =   the smallest value from the array   (absolute value of a number)<br>b = $\sqrt{\text{the largest value from the array}}$<br>c = -   a - b | -10.00 .. +5.00 |
