

1. exercise

- write the function ***get_min_med_max(array)***;
- minimum *array* length – 5 numbers;
- the function receives an *array* of numbers and returns 3 values – the smallest, the **median** and the largest number!

example:

get_min_med_max ({0,9,2,5,3}) → (0,3,9)

get_min_med_max ({9,9,2,2,4,3}) → (2,3.5,9)
